1 How We Got Here

1.1 Demystifying Enterprise Software

We started our journey with a simple question: "Why can't enterprise software be as user-friendly as consumer software?" This led us to an extensive exploration, rethinking the architecture of software development. We harnessed the power of emerging technologies to transform the landscape of enterprise solutions, making them seamlessly integrated, intuitively designed, and user-focused.

1.2 Simplicity in Configuration and Deployment

Our mission was to declutter the technology process. By segregating the "technology" layer from the "business" layer, we've made it possible for you to focus on configuring the solutions instead of programming them. We tackle the intricate details of programming and system bug resolution, allowing diverse solutions to share common system services for efficiency.

1.3 Continuous Updates, Zero Downtime

Modern software should epitomize the concept of "perpetual evolution", continuously updating and extending functions, while maintaining a smooth and disruption-free operation. No more bothersome "service windows." Your solutions stay updated and accessible, round the clock.

1.4 Innovative Vision Meets Evolved Technology Standards

By 2023, the technology ecosystem has grown to align with the innovative vision we first formulated in 2012. Web standards have matured and become richly diverse, supporting cross-platform compatibility. We are now able to deliver high-performance, device-appropriate experiences on any device, mobile or stationary. Modern client devices offer immense potential; our solutions are uniquely designed to leverage this power to its fullest.
